Attorney's Docket No.: 100201643-1

In the claims:

Please cancel claim 5.

Please amend claim 1 as follows:

-- 1. (currently amended) A support apparatus for a camera and strobe lights, comprising:
a mounting plate configured to receive a camera mounted on the mounting plate bottom surface for holding the camera substantially normal to and at a fixed distance from the photograph area;
a set of legs attached to one or more portions of the apparatus providing support and positions for mounting; and
a set of strobe lights affixed to the legs at known positions relative to the focal plane of the camera and directed towards the photograph area to facilitate acquisition of multiple photographic images capable of use in one or image processing operations. --

Version with markings to show changes made

1. (currently amended) A support apparatus for a camera and strobe lights, comprising:

a mounting plate configured to receive a camera mounted on the mounting plate bottom surface for holding the camera substantially normal to and at a fixed distance from the photograph area;

a set of legs attached to one or more portions of the apparatus providing support and positions for mounting; and

a set of strobe lights affixed to the legs at known positions relative to the focal plane of the camera and directed towards the photograph area to facilitate acquisition of multiple photographic images capable of use in one or image processing operations.
2. (previously presented) The apparatus of claim 1 wherein the image processing operations are selected from a set of image processing operations including polynomial texture mapping and shape from shading.
3. (previously presented) The apparatus of claim 1 wherein one or more legs of the set of legs are attached to and supporting the mounting plate and wherein other legs of the set legs are attached to the mounting plate and other areas of the apparatus to provide the strobe lights with different azimuthal mounting points around the mounting plate.

Attorney's Docket No.: 100201643-1

4. (previously presented) The apparatus of claim 1 wherein the mounting plate is configured to receive a camera mounted on the mounting plate top surface and looking down through an aperture in the mounting plate.

5. (canceled) ~~The apparatus of claim 1 wherein the mounting plate is configured to receive a camera mounted on the mounting plate bottom surface.~~

6. (previously presented) The apparatus of claim 1 wherein the mounting plate comprises an optically clear material and is configured to receive a camera mounted on the mounting plate top surface.

7. (previously presented) The apparatus of claim 1 wherein the mounting plate and set of legs comprises a tripod.

8. (previously presented) The apparatus of claim 1 wherein the legs are telescoping.

9. (previously presented) The apparatus of claim 1 wherein a screen is attached between each of the legs, shielding the photograph area from ambient light.

10. (previously presented) The apparatus of claim 1 wherein a screen rolls out from one leg and attaches to an adjacent leg, shielding the photograph area from ambient light.

11. (previously presented) The apparatus of claim 1 further comprising a sequence controller to control the camera and sequential firing of the set of strobe lights.

Attorney's Docket No.: 100201643-1

12. (previously presented) The apparatus of claim 1 wherein the set of strobe lights are affixed with swivel mounts that allow the strobe lights to be rotated around the axis of the legs to facilitate compaction of the apparatus.

13. (previously presented) The apparatus of claim 1 wherein the strobe lights are affixable along the axis of the leg at one or more points of fixation.

14. (previously presented) The apparatus of claim 13 wherein the points of fixation are made with detents.

15. (previously presented) The apparatus of claim 1 wherein the strobe lights are affixable along the axis of a bar wherein at least one point on the bar is attached to at least one leg.

16. (previously presented) A support apparatus for a camera and strobe lights, comprising:

a mounting plate for holding the camera normal to and at a fixed distance from the photograph area;

a set of legs attached to one or more portions of the apparatus providing support and positions for mounting; and

a mobile strobe light slidably coupled to each leg, capable of self-propelled linear motion along the axis of the leg and providing indication of its position along the leg to

facilitate acquisition of multiple photographic images capable of use in one or image processing operations.

17. (previously presented) The apparatus of claim 16 wherein the image processing operations are selected from a set of image processing operations including polynomial texture mapping and shape from shading.

18. (previously presented) The apparatus of claim 16 wherein one or more legs are attached to and support the mounting plate and other legs are attached to the mounting plate and other areas of the azimuth points around the mounting plate for mounting.

19. (previously presented) The apparatus of claim 16 wherein the mounting plate and a set of legs comprises a tripod.

20. (previously presented) The apparatus of claim 16 wherein the legs are telescoping.

21. (previously presented) The apparatus of claim 16 wherein a screen is attached between each of the legs to shield the photograph area from ambient light.

22. (previously presented) The apparatus of claim 16 wherein a screen rolls out from one leg and attaches to an adjacent leg to shield the photograph area from ambient light.

23. (previously presented) The apparatus of claim 16 further comprising a sequence controller to control the camera, position of the strobe lights, and sequential firing of the strobe lights.

Attorney's Docket No.: 100201643-1

24. (previously presented) The apparatus of claim 16 wherein the strobe lights are removable from the legs to facilitate compaction of the apparatus.

25. (previously presented) The apparatus of claim 16 wherein the strobe light rotates in elevation automatically according to its position along the leg in order to shine its light directly on the center of the photograph area.

26. (previously presented) The apparatus of claim 16 wherein the strobe light position is sensed by reading position information on the leg.

27. (previously presented) The apparatus of claim 26 wherein the position information is selected from a set of positional encodings including: optical Gray code, optical bar code, and mechanical detents.

28. (previously presented) A method of acquiring a set of photographs, comprising:

supporting a camera substantially normal to the photograph area;

positioning a set of strobe lights at predetermined positions along a set of legs; and

controlling the sequential firing of the set of strobe lights and acquisition of the resultant photographic images to be used in one or more image processing operations.

Attorney's Docket No.: 100201643-1

29. (previously presented) The method of claim 28 wherein the image processing operations are selected from a set of image processing operations including polynomial texture mapping and shape from shading.

30. (previously presented) The method of claim 28 wherein one or more legs of the set of legs are attached to and support the mounting plate and wherein other legs of the set of legs are attached to the mounting plate and other areas of the apparatus to provide the strobe lights with different azimuthal points around the mounting plate.

31. (previously presented) The method of claim 28 wherein the strobe lights are repositioned and sequentially fired to obtain additional photographic images to be used in polynomial texture mapping.

32. (previously presented) A method of acquiring a set of photographs using a supported camera and movable strobe lights, comprising:

calculating a first strobe light position and second strobe light position along the axis of a leg supporting the strobe light;

moving at least one strobe light to the first strobe light position automatically;

controlling the firing of at least one strobe light in the first strobe light position and acquisition of the resultant photographic image to be used in polynomial texture mapping; and

Attorney's Docket No.: 100201643-1

moving automatically one strobe light from the first strobe light position to the second strobe light position.

33. (previously presented) The method of claim 32 wherein the first strobe light position and the second strobe light position are determined according to a photograph sequence parameter that specifies the number of photograph sequences to be obtained; and wherein a photograph sequence represents photographic images lit by strobe lights in a set of positions.

34. (previously presented) The method of claim 33 further comprising one or more intermediate strobe light positions between the first strobe light position and the second strobe light position.

35. (previously presented) The method of claim 34 wherein the positions between the first strobe light position and the second strobe light position are spaced along the axis of the leg to provide consistent linear angular displacements with respect to the photographic subject.

36. (previously presented) An apparatus for acquiring a set of photographs, comprising:

means for supporting a camera normal to the photograph area;

means for positioning strobe lights at predetermined positions along the legs attached to one or more portions of the apparatus; and

means for controlling the sequential firing of the positioned strobe lights and acquisition of the resultant photographic images to be used in one or more image processing operations.

Attorney's Docket No.: 100201643-1

37. (previously presented) An apparatus for acquiring a set of photographs using a supported camera and strobe lights that are movable along the apparatus, comprising:

means for calculating a first strobe light position and second strobe light position along the axis of a leg supporting at least one strobe light;

means for moving automatically at least one strobe light to the first strobe light position;

means for controlling the firing of at least one strobe light in the first strobe light position and acquisition of the resultant photographic images to be used in polynomial texture mapping; and

means for moving automatically at least one strobe light from the first strobe light position to the second strobe light position.
